## PREFACE

The following individuals were employed by the Department during Water Year 1981, October 1, 1980 to October 1, 1981. Those persons that made measurements on streams, canals or pumps, listed in this report, are noted by an asterisk preceding their name. A special note is made of the patient work performed by Judith A. Huwaldt and Dorothy A. Brening in typing and compiling this report.

## HYDROGRAPHIC REPORT 1981

### INTRODUCTION

The Hydrographic Report provides a record of stream flow, diversions for irrigation, reservoir storage and related data pertaining to water resources utilization in Nebraska, which are not published by the United States Geological Survey. All measurement sites are referenced to the legal coordinates of the U.S. Bureau of Land Management. The records are listed in downstream order according to river basin and sub-basin.

The basic stream gaging program in Nebraska is carried on under a cooperative agreement between the Water Resources Division, U.S. Geological Survey, and the Nebraska Department of Water Resources. Additional stream flow records are collected in the state by the U.S. Geological Survey in cooperation with other state, local or federal agencies. Such cooperative discharge records are published annually by the Geological Survey as Nebraska Surface Water Records.

Copies of this Hydrographic Report may be obtained by addressing the Nebraska Department of Water Resources, P.O. Box 94676, Lincoln, Nebraska 68509. Copies of the publication Water Resources Data for Nebraska may be obtained by addressing the District Chief, U.S. Geological Survey, Room 406, Federal Building, U.S. Court House, Lincoln, Nebraska 68508, or the Nebraska Department of Water Resources.

## EXPLANATION OF DATA

The hydrologic data presented in this report was obtained during Water Year 1981 (October 1, 1980 through September 30, 1981). All instantaneous and daily discharge values are expressed in cubic feet per second. Monthly and annual discharge values and reservoir storage totals are listed in acre-feet. The data may be converted to other common units of measurement using the table of equivalents listed below:

1 cubic foot . . . . .	7.48 gallons....62.4 lbs. of water
1 acre foot . . . . .	.43,560 cubic feet....325,851 gallons
1 cubic foot per second (cfs) . . . . .	.448.8 gallons per minute
1 cfs for 24 hours. . . . .	. . . . . 1.983 acre-feet
1,000 gallons per minute. . . . .	. . . . . .2.23 cfs
1,000 gallons per minute. . . . .	. . . . . .4.42 acre-feet per day

The data presented in the first section of the report includes mean daily discharges for streams and canals, and monthly reservoir storage totals. The mean daily discharge values were obtained from water stage recorders, or readings taken by an observer. Instantaneous peak discharges are published for streams having recording gages which operate year-round.

The water diverted from streams into canals is measured at gages located as close as possible to the canal headgates. The legal description of the land on which the measuring device is situated, is provided in the heading for each record. The acres to be irrigated, by virtue of the listed appropriations, are noted at the foot of each diversion record. Section 46-261, R.R.S., Nebraska, 1943, requires that canal owners or operators must submit a verified list of lands to be irrigated to the Department by April 1st of each year. The actual amount of land irrigated is sometimes different than that reported because of unforeseen circumstances, such as the weather.

Many discharge measurements are made on streams, canals and pumps, in the course of administrating water rights. These measurements are listed in the second and third sections of the report. The measurements define the quantity of flow at the time the reading was obtained. Many sites on streams and canals are visited several times per year, and include measurements taken under base flow conditions. Base flow conditions occur when streamflow consists entirely of ground water seepage, and vegetative growth in the channel is negligible.

Pathfinder storage included							

\*The water from drains was originally diverted at Whalen from the North Platte River and carried through the Interstate Canal for lands within the Pathfinder Irrigation District. The residue of the Whalen diversion after it has been used on the Pathfinder District lands together with surface runoff is intercepted by the Tri-State Canal and conveyed for res-use on Northport Irrigation District's lands.
