## HYDROGRAPHIC REPORT 1987

### INTRODUCTION

The Hydrographic Report provides a record of streamflow, diversions for irrigation, reservoir storage and related data pertaining to water use in Nebraska. All measurement sites are referenced to the legal coordinates of the United States Bureau of Land Management. The records are listed in downstream order according to river basin and subbasin.

The basic stream gaging program in Nebraska is carried out under a cooperative agreement between the Water Resources Division, United States Geological Survey and the Nebraska Department of Water Resources. These records are published annually by the U.S. Geological Survey in the report titled Water Resources Data for Nebraska. Additional streamflow records published here are collected by the Department of Water Resources in cooperation with organizations acknowledged in the record. Storage data for reservoirs in the Papillion and Salt Creek Basins was provided by the U.S. Army Corps of Engineers, Missouri River Division. These records are published in the Hydrographic Report.

Data from both the gaging stations operated under the cooperative agreement and those operated by the Department are available from the Nebraska Natural Resources Commission's computerized Data Bank. Streamflow, canal diversion and reservoir storage records for years preceding the current year's data published in this report, may be retrieved by contacting the Data Bank Administrator, Nebraska Natural Resources Commission, P.O. Box 94876, Lincoln, Nebraska 68509-4876.

Copies of the Hydrographic Report may be obtained by addressing the Department of Water Resources, P.O. Box 94676, Lincoln, Nebraska 68509-4676. Copies of the publication Water Resources Data for Nebraska may be obtained by addressing the District Chief, U.S. Geological Survey, Room 406, Federal Building and U.S. Courthouse, Lincoln, Nebraska 68508, or the Department of Water Resources.

## EXPLANATION OF DATA

The hydrologic data presented in this report was obtained during calendar year 1987. All instantaneous and daily discharge values are expressed in cubic feet per second. Monthly and annual discharge values and reservoir storage totals are expressed in acre-feet. The data may be converted to other common units of measurement using the table of equivalents listed below:

|                                         |                                      |
|-----------------------------------------|--------------------------------------|
| 1 cubic foot . . . . .                  | 7.48 gallons or 62.4 lbs. of water   |
| 1 cubic foot . . . . .                  | 0.02832 cubic meters                 |
| 1 acre-foot . . . . .                   | 43,560 cubic feet or 325,851 gallons |
| 1 cubic foot per second (cfs) . . . . . | 448.8 gallons per minute             |
| 1 cfs for 24 hours . . . . .            | 1.983 acre-feet                      |
| 1,000 gallons per minute . . . . .      | 2.23 cfs                             |
| 1,000 gallons per minute . . . . .      | 4.42 acre-feet per day               |

The data presented in the first section of the report includes mean daily discharges for streams and canals, and both daily and monthly reservoir storage values. The mean daily discharge values were obtained from water stage recorders, or readings taken by an observer.

The water diverted from streams into canals is measured at gages located as near as possible to the canal headgates. The legal description of the land on which the measuring device is situated is provided in the heading for each record. The length of time that the station has been operated is also listed in the heading. Appropriations served by a diversion are listed at the bottom of each record.

Many discharge measurements are made on streams, canals and pumps in the course of regulating diversions to water users. In addition to measurements taken during times of water shortage, numerous sites on streams and canals are measured several times per year on a regular basis. Those measurements are listed in the second and third sections of the report. The measurements define the quantity of flow at the time the reading was obtained. A number of the miscellaneous streamflow measurements were taken under base-flow conditions. Base-flow conditions occur when streamflow consists entirely of ground water seepage, with no withdrawal for irrigation and minimum vegetation growth.

SUTHERLAND POWER RETURN to the South Platte River - 1987  
Gage Location: NE1/4 Sec. 21-13-30 W.  
at North Platte  
Measuring Device: Differential pressure recorder  
Period of Record: 1939 - 1987

## SOUTH PLATTE RIVER BASIN

FREMONT SLOUGH NO. 1 at North Platte - 1987  
Gage Location: NW1/4 Sec. 16-13-30 W.  
Measuring Device: Stage observation  
Period of Record: 1947 - 1961, 1963 - 1965, 1967 - 1987

## PLATTE RIVER BASIN

41

## CONFLUENCE OF THE NORTH AND SOUTH PLATTE RIVERS near North Platte - 1987

Period of Record: 1949 - 1987

The values listed are the sum of the discharges of the North and South Platte Rivers, the Sutherland Power Return and Fremont Slough measured at the North Platte, Nebraska gaging stations.

1 Capacity to top of irrigation pool consists of 64,780 a.f. of dead and power head water, 100,000 storage for irrigation and 20,090 evaporation loss.

2 When maximum storage exceeds capacity of irrigation pool, it indicates some water is being held in flood control pool.

a 1970-1987 record for average

b 1981-1987 record for average - water stored for recreation

c 1985-1987 record for average

NOTE: There is no irrigation water storage in the Oliver Reservoir
