**ANNUAL REPORT OF WATER USE ACTIVITIES
IN THE SOUTH PLATTE NATURAL RESOURCES DISTRICT
TO MEET THE REQUIREMENTS OF THE INTEGRATED MANAGEMENT PLAN
FOR THE 2016 BASIN-WIDE MEETING**

I. GENERAL SUMMARY

- A. The following is a compilation of records, statistics and historic conditions of water use which have been tracked by the South Platte Natural Resources District (SPNRD) for 2015. All information supplied for this summary is available within a GIS database, complete with the locations and attributes. This report has been compiled for the June 16, 2016 Basin-Wide meeting.

II. INTRODUCTION

- A. This report is intended to satisfy the SPNRD tracking and reporting requirements as described by the Monitoring and Studies section of the SPNRD Integrated Management Plan (IMP). The SPNRD will be responsible for tracking the following activities within the District on an annual basis: (1) certification of ground water uses and any changes to these certifications; (2) approved transfers, including all of the information provided with the application and used in the approval of the transfer; (3) any flow meter data collected; (4) any water well construction permits issued; (5) any other permits issued by the SPNRD; (6) any conditions associated with any permits issued; (7) information gathered through the municipal and non-municipal industrial accounting process; (8) any variances issued, including: the purpose, the location, any required offset, the length of time for which the variance is applicable and the reasoning behind approval of the variance; (9) any retirements of irrigated acres or other activities by the SPNRD for the purpose of returning to a fully appropriated condition; (10) information related to any water banking transactions; and (11) offsets provided for depletions resulting from increased consumptive use related to the above listed items.

The items tracked and reported will subsequently be used by the SPNRD and the Department of Natural Resources (DNR) to measure the success of the controls, incentive measures and other action items contained in the IMP at meeting the goals and objectives of the IMP. Two evaluation processes for measuring success are described in the IMP. The first is an annual evaluation that will forecast the balance of depletions and accretions from the report year through 2048. The second evaluation occurs periodically and will be more robust, including updating and running ground water models. These evaluation processes will be carried out by the SPNRD and the DNR after the annual basin-wide meeting. The tracking, reporting, and evaluation processes are described in more detail in the Monitoring and Studies section of the IMP. In addition to the evaluation processes, the information that is tracked and reported will also be used by the State to help meet requirements of the Platte River Recovery Implementation Program (Program).

III. CERTIFIED ACRES

- A. The SPNRD began certifying ground water irrigated acres in October 2002 and ended the certification process in the first half of 2006. The SPNRD certified irrigated acres are based on historically irrigated acres proven by Farm Service Agency (FSA) maps, tax records or other appropriate documentation.

The SPNRD has two types of certified acres; active and inactive. Inactive acres are any certified acres that belong to wells that are inactive and do not have a flow meter installed and do not receive an allocation. These unused wells are enrolled in a SPNRD program called Temporary Deferment. Active acres are all acres that are being irrigated or have a flow meter installed and therefore receive an allocation. Detailed data regarding the number of certified irrigated acres can be found in Appendix A. Map 1 provides a look at the state designated areas in the SPNRD.

IV. APPROVED TRANSFERS

- A. For 2015, the District approved five (5) transfers. See Appendix B, Table 1 for a more detailed look at the transfers.
 - 1. One transfer involved moving around existing certified acres to allow for a new pivot to be installed. No expansion of acres occurred, just moving existing acres to new locations to make the operator more efficient.
 - 2. Four transfers that the SPNRD Board approved all dealt with industrial transfers. Three transfers were for irrigation allocation to be used as an offset to an industrial use. The other transfer is a retirement of certified irrigated acres which was used as an offset for an industrial use.

V. WELL CONSTRUCTION PERMITS

A. Supplemental Ground Water Wells

- 1. The SPNRD issued no supplemental ground water wells.

B. Supplemental Surface Water Wells

- 1. The SPNRD issued no supplemental surface water well permits.

C. Replacement Wells

- 1. The SPNRD issued five (5) replacement well permits. These are replacement wells for a well that has already been registered. All of these replacement permits were for wells that were not producing the amount of water for which they were originally designed to pump. This could be due to several reasons such as casing collapse, pumping sand, water table drop or other reasons.

D. Temporary Wells

- 1. The SPNRD issued no temporary well permits.

E. De-Watering Wells

1. The SPNRD issued no de-watering well permits.

F. Other Permits

1. The SPNRD issued one (1) new well permit for an industrial well that was designed to pump fifty (50) gallons per minute or less. This well was used for turf irrigation of a small cemetery owned by the Village of Potter.

VI. VARIANCES

A. The SPNRD considers any request that is contrary to existing rules or regulations of the SPNRD or DNR as a variance. The SPNRD has a Variance Advisory Group that reviews and makes recommendations to the SPNRD Board of Directors on all irrigation related variances requested. All industrial and municipal variance requests go directly to the SPNRD Board of Directors. The Board reviews variances on a case-by-case basis, and as the elected governing body; the Board makes the final determination.

In 2015 there were two (2) approved variances. Both approved variances allowed transfers to cross subarea boundaries. See Appendix B, Table 2 for more information.

VII. MUNICIPAL AND INDUSTRIAL ACCOUNTING

A. The SPNRD began implementing the Industrial Accounting portion of the IMP in early 2010. Industrial wells were identified through the DNR registered well database and had to pump greater than 50 gallons per minute. The SPNRD decided that in order for an industrial user to obtain a baseline certification they must have pumping history for every year during the five-year period from August 1, 2001 through July 31, 2006. Unless a variance is granted, a user that has not met this five-year pumping history criterion will be given a non-baseline certification, and that user will be responsible for offsetting the water use. The SPNRD allows industrial users who have a non-baseline certification to offset new or expanded uses through transfers including irrigation allocation(s), certified irrigated acres or the District's water bank.

Currently, the SPNRD has twenty-five (25) non-baseline certifications. Twelve of the twenty-five had or could have had an active industrial use in 2015 and all water pumped will be offset by an existing irrigation allocation as agreed upon by the user and the SPNRD Board of Directors. Non-baseline certifications can change annually as temporary transfers expire and get removed from the list, and new temporary transfers are approved by the Board and are added to the list. See Appendix C table for a breakdown of non-baseline industrial uses.

In 2010, the SPNRD granted variances from the baseline certification process. These variances were made for established industries in the SPNRD who were unable to document water usage back to August 1, 2001. Two of these industries remain within the SPNRD and they were required to install a flow meter and allowed to go forward three years from the time of installation. After three years a baseline will be issued based on

the highest amount pumped during the three year period. This baseline will then be used as the amount pumped from August 1, 2001 until the time of establishment. After the baseline becomes established regular accounting will start from that point forward. See Appendix D for further information on active industrial variances.

Seventeen industries now have established baselines. These industries either had records of water sales, tax receipts, flow meter readings, electrical power records, previous irrigation pumping history, etc. which could be documented back to August 1, 2001 and used to establish the approved baseline, or have had baselines approved through a variance. The baselines were determined in one of three ways. First was by figuring the amount of water consumed by the industry between August 1, 2001 and July 31, 2006; second was by converting certified irrigated acres into an industrial baseline by board approval; and third was by board approval of a variance request. All of these industries now currently have flow meters installed which are read on a monthly basis. None of the previously mentioned industries discharge any water and all pumping is looked at as one hundred (100) percent consumptive use. The SPNRD tracks both industrial and municipal use on an August 1st to July 31st timeframe. See Appendix E for a list of existing industries and how their baselines compare with current pumping.

- B. The SPNRD has certified baselines for all ten municipal water systems in the District. Municipal baselines include information from all wells the municipality uses that pump over 50 gallons per minute. The Chappell, Potter, and Sidney golf courses are all figured into their municipal baselines. Baselines were figured with the best known data at the time.

Sidney, Chappell, and Kimball discharge some or all of their waste water back into Lodgepole Creek. Lodgepole previously had discharged waste water back into the creek but in 2012 went to full retention lagoons. The rest of the remaining municipalities' waste water is held in full retention lagoons.

Similar to industrial baselines, municipal baselines were calculated by documenting usage between August 1, 2001 and July 31, 2006. The highest one year period (August 1st to July 31st) during this time was then used as that municipality's baseline. Appendix F shows the municipal baselines, per capita use, and current year usage.

VII. IRRIGATION FLOW METER DATA

- A. The SPNRD Board in January 2004 required flow meters to be installed on all irrigation wells. Flow meters were then installed incrementally through March 2009. All certified irrigated acres located in the Lodgepole Creek Valley have had an allocation in place beginning in 2007. The remainder of the District (Tablelands and South Platte Valley) has had an allocation in place since 2009.

The SPNRD Board in March 2012 decided the irrigation allocations for all subareas within the district for the years 2013-2015. The Board lowered the allocation in all fully appropriated subareas by thirty percent from twenty acre-inches to fourteen acre-inches

(42 acre-inches over three years); this area is also known as the Tablelands. The fully appropriated subareas also went from a four year allocation period to a three year allocation period.

The allocation in two overappropriated subareas was also lowered. The South Platte Valley subarea was lowered by ten percent from twenty acre-inches to eighteen acre-inches (54 acre-inches over three years) and also went from a four year allocation period to a three year allocation period. The allocation the Oliver Reservoir to Buffalo Bend subarea was lowered by twelve and half percent from sixteen acre-inches to fourteen acre-inches (42 acre-inches over three years). The three remaining overappropriated subareas remained the same: Pine Bluffs to Oliver and Buffalo Bend to Sidney subareas remained at fourteen acre-inches (42 acre-inches over three years), and Sidney to Colorado subarea remained at sixteen acre-inches (48 acre-inches over three years).

Appendix G summarizes the allocation history of the SPNRD. See Map 2 for a breakdown of allocation amounts per subarea through the end of 2015. Appendix H provides a detailed look at irrigation water usage for the entire SPNRD from 2012 through 2015.

IX. RETIRED ACRES AND OTHER STREAM FLOW ACCRETION ACTIVITIES

- A. The SPNRD will implement measures within the first ten (10) year increment of the IMP to offset an average annual depletion rate of one hundred fifty (150) acre-feet to the North Platte River, four hundred (400) acre-feet to the South Platte River, and one hundred fifty (150) acre-feet to Lodgepole Creek for the period 2043-2048. These rates are the current best estimates and are subject to change based upon new data and information.

Through 2015, the SPNRD retired or decertified 1,651 acres equating to an estimated 714 acre-feet of water benefitting the Lodgepole Creek. These acres are all located in the over appropriated Lodgepole Creek Valley. See Appendix I for a complete breakdown of all retirement activities.

X. OTHER ACTIVITIES

- A. The SPNRD and North Platte Natural Resources District (NPNRD) began work on a regional ground water model, Western Water Use Model (WWUM), for the two Districts in 2009. This regional model will build upon the modeling work that was completed during SPNRD and NPNRD's time spent participating in COHYST. The SPNRD and NPNRD share a ground water modeler, Thad Kuntz, P.G., with Adaptive Resources, Inc.
- B. The SPNRD, Twin Platte Natural Resources District (TPNRD), and NDNR worked together on a recharge project with Western Irrigation District. During the spring of 2015 the SPNRD diverted water thirty-one (31) days for the recharge project during excess flows on the South Platte River. Also, in the fall of 2015 the SPNRD diverted water five (5) days for another recharge project during excess flows on the South Platte River. A project summary for the TPNRD and SPNRD Re-use pits and canal recharge projects for 2015 has not yet been prepared.

- C. The SPNRD, NPNRD and the TPNRD in September of 2013 applied for a Nebraska Environmental Trust grant for the Hydrogeology of Western Nebraska. This grant will be used to evaluate oil and gas logs to help better determine the base of the Ogallala Aquifer.

XI. GROUND WATER LEVELS

- A. Tracking and reporting of ground water levels is not required in the IMP. The SPNRD measures 204 observation wells in the spring and fall annually.

* 2015 Gallons are calculated from the industrial water year of August 1, 2014 through July 31, 2015.

** These wells are in the fully appropriated area of the District and are over their five year baseline; the SPNRD has worked through the Platte Basin Coalition to secure an offset by retiring irrigated acres.

*** Well G-041367 received a variance to establish a partial baseline because pumping did not occur during all five baseline years. If the baseline amount of 5,650,134 gallons is exceeded, all offsets will be automatically deducted from certified irrigated tract #15N56W230005. See 2/5 variance request in the 2010 report.

**** The baseline for this well increased this year with approved transfer TR-IND-14-Cabela's-SO-2015.

* Calculated by removing the high use tract and the tracts that did not use any water, then calculated the usage of all tracts individually and averaged those numbers.

** Crop Water Usage is based off of the number of acres per crop, which are based on field observations taken at the time flow meters are read. Crop Water Usage could be subject to change as more accurate crop-acre information becomes available.

***Inactive Certified Irrigated Acres are acres enrolled in Temporary Deferment or incentive programs that offer incentives to discontinue irrigation use on a temporary basis.

Appendix I
SPNRD Water Acquisitions and Water Banking Activities Through 2015
Retired Acres and Other Stream Flow Accretion Activities

Landowner	Decertified Acres	Stream Depletion (%)	Acre Feet Accrued	Township	Range	Section	Date Retired	County	Subarea	Appropriation
